Aspect ratios define the proportions of an image or video, and while the exact sizes may vary, maintaining the correct proportions is essential. These sizes are designed to be large enough to ensure that images and videos remain sharp and clear when viewed.

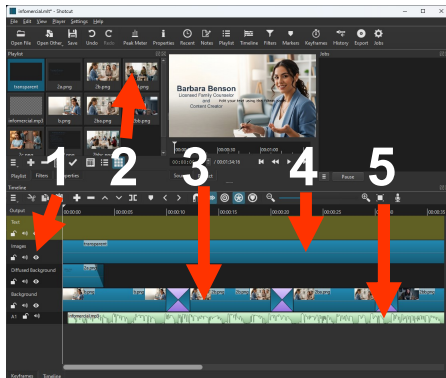

Once you have decided on the format needed for your ad, provide the AI with the appropriate dimensions listed above. Your prompt should include the size (9 x 16), a resolution of 125, and the format as PNG.

After downloading the images, arrange them in the order you want them to appear and label them 1 through 8. Once you place the images into the folder, they will automatically populate within the template.

As long as all images maintain the same size and resolution, your video will be ready to save.
